ABOUT ME

Full-Stack Developer with experience in AWS Cloud, with a background in aviation, where I developed discipline, punctuality, teamwork, effective communication, and a strong customer service mindset. After a successful career transition into tech through an intensive bootcamp, I have real experience in full-stack web development and serverless architectures on AWS, participation in tech communities, and end-to-end personal projects with modern technologies. I'm currently looking for new challenges in multicultural environments where I can combine my experience in web development and AWS with my constant learning ability and teamwork skills.

PROJECTS

Travel World – Serverless Travel E-commerce Platform (AWS) | In Development

Personal full-stack project featuring build-your-own travel packages, booking management, and a complete cloud infrastructure on AWS.

- Architected and deployed a serverless backend using AWS CDK (Infrastructure as Code) with Lambda, API Gateway, DynamoDB, and SNS, designing RESTful APIs protected by Cognito authorizers that support both registered user and guest flows.
- Implemented authentication and authorization with Amazon Cognito, including user pools, identity pools, and role-based access control (admin/guest), and built a booking system with real-time admin notifications via Amazon SNS, triggered automatically on each new reservation.
- Set up CloudWatch dashboards and alarms for Lambda monitoring and error tracking, and configured an S3 bucket for storing and serving travel package images, with public read access and CORS policies for frontend integration.
- Deployed the React/TypeScript frontend via AWS Amplify and automated infrastructure deployments to AWS using GitHub Actions with OIDC authentication (no long-lived credentials), triggering cdk deploy on every push to main.

Serverless AI Workflow Orchestration – Destination Autocomplete Workflow

Standalone project extracted from Travel World, a serverless travel e-commerce application, isolating an AI-powered orchestration workflow to automate destination data entry in an admin dashboard.

- Architected and deployed a serverless orchestration workflow using AWS CDK with two Step Functions state machines: an EXPRESS sync workflow calling the OpenAI API to auto-generate destination data from an image, and a STANDARD fire-and-forget workflow generating promotional emails with Amazon Bedrock (Claude Haiku) and publishing them via SNS, reducing destination creation time from minutes to seconds.
- Built direct SDK service integrations within the state machines (S3 GetObject, Bedrock InvokeModel, SNS Publish) instead of glue Lambdas, using Retry/Catch blocks for resilient error handling and full execution visibility, with a secure outbound connection to OpenAI via EventBridge and credentials in Secrets Manager.
- Secured REST APIs with API Gateway API keys and usage plans (rate limiting, burst control, monthly quotas), and set up CloudWatch dashboards to monitor Step Functions execution metrics across both workflows.
- Automated infrastructure deployments to AWS using GitHub Actions CI/CD with OIDC authentication (no long-lived credentials), triggering cdk deploy on every push to main.

Agile Methodologies: Experience with Scrum, using tools like Jira, Confluence, and Bitbucket for task management, documentation, and version control, participating in daily stand-ups to review progress, address challenges, and align daily goals.

HTML | CSS | JAVASCRIPT | TYPESCRIPT | REACT | REACT ROUTER DOM | NODEJS | EXPRESS | NEST | POSTGRESQL | MONGODB | MONGOOSE | SEQUELIZE | PRISMA | TYPEORM | TAILWIND | REDUX | GITHUB | POSTMAN | JEST | CYPRESS | CLOUDINARY | NODemailer | DOCKER | SWAGGER | JSONWEBTOKEN | BCRIPTJS | MERCADOPAGO | LANGCHAIN | GOOGLE GEMINI | AWS CDK | AWS LAMBDA | AWS API GATEWAY | AWS DYNAMODB | AWS COGNITO | AWS AMPLIFY | AWS SNS | AWS CLOUDWATCH | AWS IAM

WORK EXPERIENCE

Fullstack Developer en Hotelinking

06/2025 | Palma de Mallorca, Spain | Present

Travel tech platform trusted by 2,000+ hotels worldwide.

- Development and maintenance of frontend and backend features on a travel tech platform focused on the digitalization and automation of hotel operations.
- Managed and resolved tickets across two simultaneous projects in an agile environment, collaborating daily with the team to ensure efficient deliveries aligned with product goals.
- Development and optimization of features related to hotel operations, such as check-in/check-out processes, automation, and data management, aimed at improving user experience and operational efficiency.

Tech stack: Vue.js, PHP, Laravel, Docker, Confluence, Bitbucket, AWS, Jira, Augment Code (AI).

EDUCATION

JavaScript Bootcamp on Plataforma 5

09/2023

Agile methodologies: Scrum, Planning, Daily Stand-up, Review, Demo, and Trello.

Intensive 7-month full-stack bootcamp with 1,000+ hours of coding, pair-programming, and Agile/Scrum methodology.
